1/6.5'' VGA CMOS Image Sensor GC0308

DataSheet

Only for FAE

2010-06-01

GalaxyCore Inc.

Content

1. Sensor Overview

1.1 General Description

The GC0308 features 640V x 480H resolution with 1/6.5-inch optical format, and 4-transistor pixel structure for high image quality and low noise variations. It delivers superior image quality by powerful on-chip design of a 10-bit ADC, and embedded image signal processor.

The full scale integration of high-performance and low-power functions makes the GC0308 best fit the design, reduce implementation process, and extend the battery life of cell phones, PDAs, and a wide variety of mobile applications.

The on-chip ISP provides a very smooth AE (Auto Exposure) and accurate AWB(Auto White Balance) control. It provides various data formats, such as Bayer RGB, RGB565, YCbCr 4:2:2. It has a commonly used two-wire serial interface for host to control the operation of the whole sensor.

The product is capable of operating at up to 30 frames per second at 24MHZ clock in VGA mode, with complete user control over image quality and data formatting.

1.2 Features

◆ Standard optical format of 1/6.5 inch

◆ Various output formats: YCbCr4:2:2, RGB565, Raw Bayer

◆ Single power supply requirement (2.8v)

◆ Windowing support

◆ Horizontal /Vertical mirror

◆ Image processing module

◆ Package: CSP

1.3 Application

◆ Cellular Phone Cameras

◆ Notebook and desktop PC cameras

◆ PDAs

◆ Toys

◆ Digital still cameras and camcorders

◆ Video telephony and conferencing equipments

◆ Security systems

◆ Industrial and environmental systems

◆ Bar code reader

1.4 Technical Specifications

Parameter	Typical value
Optical Format	1/6.5 inch
Pixel Size	3.4um x 3.4um
Active pixel array	648 x 488
ADC resolution	10 bit ADC
Max Frame rate	30fps@24Mhz,VGA
Power Supply	2.7 ~ 3.3V, typical 2.8V
Power Consumption	TBD
SNR	TBD
Dark Current	TBD
Sensitivity	TBD
Operating temperature:	-30~80℃
Stable Image temperature	-10~60℃
Optimal lens chief ray angle(CRA)	27º
Package type	CSP

1.5 Block Diagram
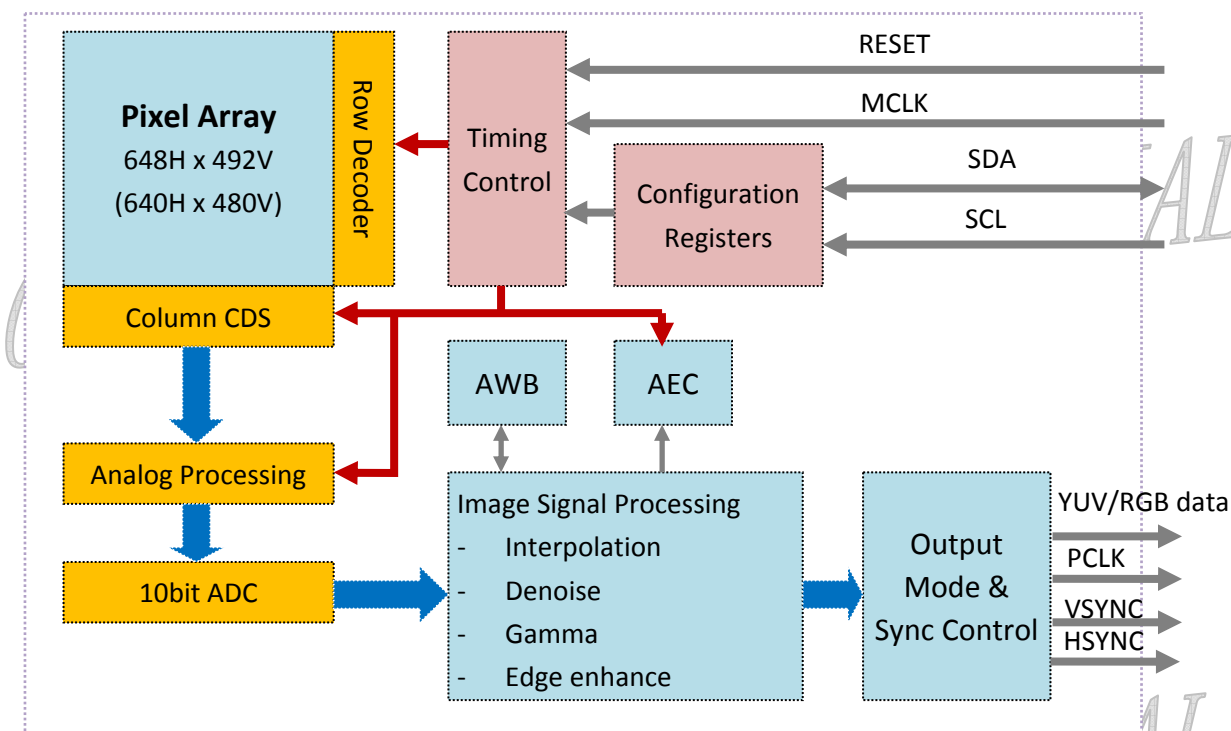

GC0308 has an active image array of 648x488 pixels. The active pixels are read out progressively through column/row driver circuits. In order to reduce fixed pattern noise, CDS circuits are adopted. The analog signal is transferred to digital signal by 10 bit A/D converter. The digital signals are processed in the ISP Block, including Bayer interpolation, denoise, color correction, gamma correction, data format conversion and so on. Users can easily control these functions via two-wire serial interface bus.

1.6 Pixel Array
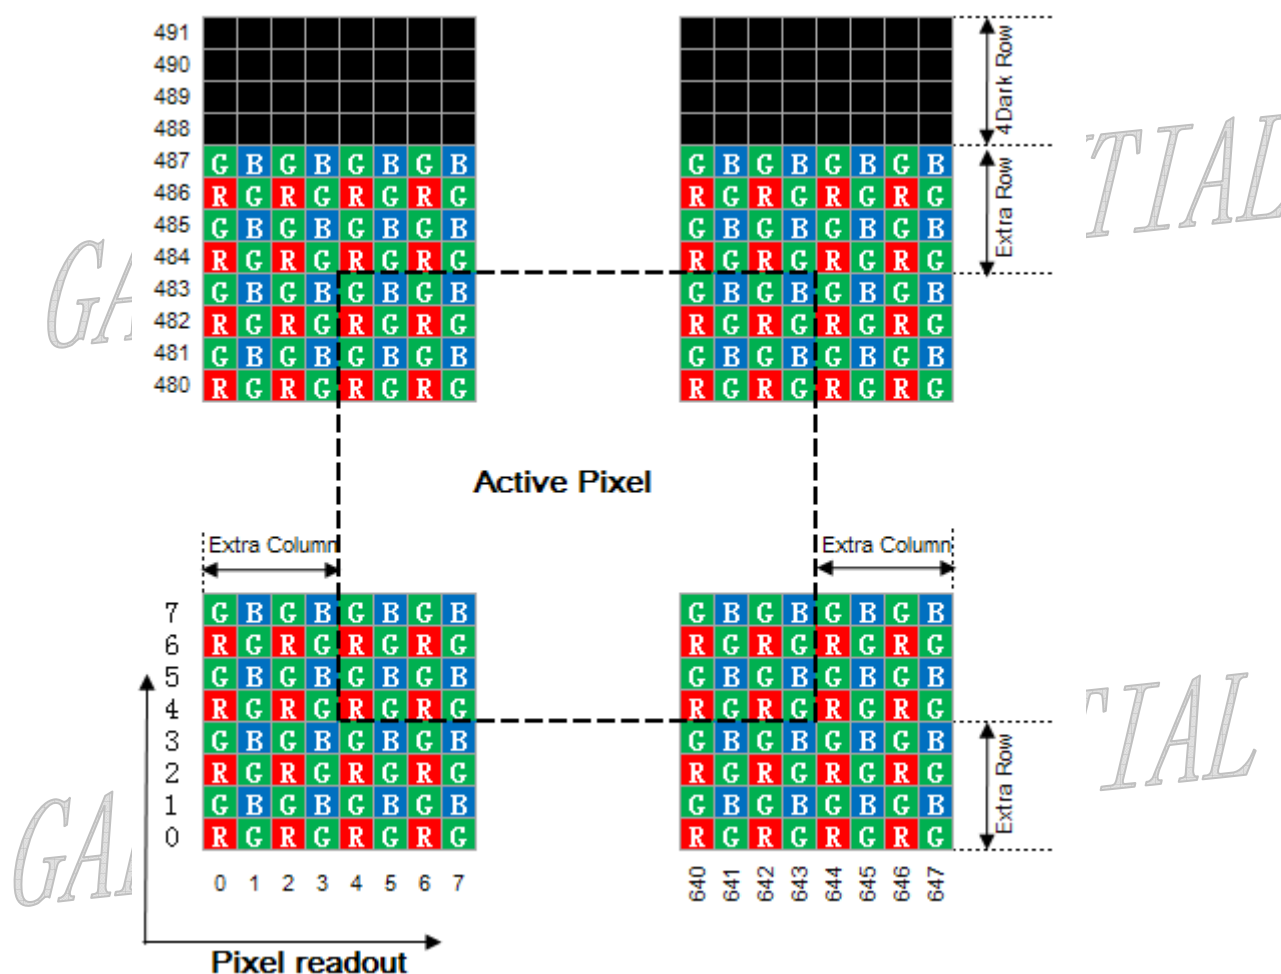

Pixel array is covered by Bayer pattern color filters. The primary color BG/GR array is arranged in line-alternating way.

If no flip in column, column is read out from 0 to 647. If flip in column, column is read out from 647 to 0.

If no flip in row, row is read out from 0 to 487. If flip in row, row is read out from 487 to 0.

2. Color Filter Spectral Characteristics

The optical spectrum of color filters is shown below
3. Two-wire Serial Bus Communication

GC0308 Device Address:

serial bus write address = 0x42, serial bus read address = 0x43

3.1 Protocol

The host must perform the role of a communications master and GC0308 acts as

either a slave receiver or transmitter. The master must do

♦ Generate the **Start(S)/Stop(P)** condition
♦ Provide the serial clock on **SBCL**.
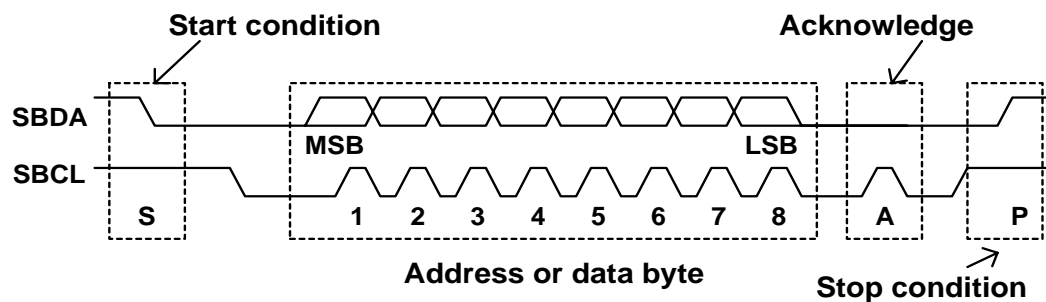

Single Register Writing:

S	42H	A	Register Address	A	Data	A	P
Incremental Register Writing:

| S | 42H | A | Register Address | A | Data(1) | A | ...... | Data(N) | A | P |

Single Register Reading:

| S | 42H | A | Register Address | A | S | 43H | A | Data | NA | P |

Incremental Register Reading:

| S | 42H | A | Register Address | A | S | 43H | A | Data(1) | A | ...... | Data(N) | NA | P |

Notes:

☐ From master to slave   ☐ From slave to master

S: Start condition   **P:** Stop condition

A: Acknowledge bit   **NA:** No acknowledge

Register Address: Sensor register address

Data: Sensor register value

3.2 Serial Bus Timing
Parameter	Symbol	Min.	Max.	Unit
SBCL clock frequency	fscl	0	400	KHz
Bus free time between a stop and a start	tbuf	1.2	*	μs
Hold time for a repeated start	thd;sta	1.0	*	μs
LOW period of SBCL	tlow	1.2	*	μs
HIGH period of SBCL	thigh	1.0	*	μs
Set-up time for a repeated start	tsu;sta	1.2	*	ns
Data hold time	thd;dat	1.3	*	ns
Data Set-up time	tsu;dat	250	*	ns
Rise time of SBCL, SBDA	tr	*	250	ns
Fall time of SBCL, SBDA	tf	*	300	ns
Set-up time for a stop	tsu;sto	1.2	*	μs
Capacitive load of bus line (SBCL, SBDA)	Cb	*	*	pf

4. Timing

Suppose Vsync is low active and Hsync is high active, and ouput format is YCbCr/RGB565, then the timing of vsync and hsync is bellowing:
$Ft = VB + Vt + 8$　　（unit is row_time）

$VB = Bt + St + Et$，　Vblank/Dummy line，setting by register 0x0f[7:4] and 0x02.

Ft -> Frame time，one frame time

Bt -> Blank time，Vsync no active time.

St -> Start time，setting by register 0x0d.

Et –> End time，setting by register 0x0e.

Vt -> valid line time. VGA is 480，$Vt = win\_height - 8$，win_height is setting by register 0x09 和 0x0a（488）。

When $exp\_time <= win\_height + VB$，$Bt = VB - St - Et$。Frame rate is controlled by window_height+VB。

When $exp\_time > win\_height + VB$，$Bt = exp\_time - win\_height - St - Et$。Frame rate is controlled by exp_time。

The following is row_time calculate:

$row\_time = Hb + Sh\_delay + win\_width + 4$.

Hb –> HBlank or dummy pixel，Setting by register 0x0f[3:0] and 0x01.

Sh_delay -> Setting by register 0x12.

win_width -> Setting by register 0x0b and 0x0c, win_width =

6final_output_width + 8. So for VGA, we should set win_width as 648.

5. DC Parameters

Symbol	Parameter	Min	Typ	Max	Unit
VDD28	Power supply	2.7	2.8	3.3	V
I_{DD}	Active(Operating) Current	--	25	--	mA
$I_{DDS-PWDN}$	Standby Current	--	10	--	uA
V_{IH}	Input voltage HIGH	0.7* VDD28			V
V_{IL}	Input voltage LOW			0.2* VDD28	V
V_{OH}	Output voltage HIGH	0.9* VDD28			V
V_{OL}	Output voltage LOW			0.1* VDD28	V
I_{OH}	Output current HIGH	8			mA

6. Register List

Analog & CISCTL

Address	Name		Width	Default Value	R/W	Description
P0:0x00	**Chip_ID**		**8**	**0x9b**	**RO**	**Chip version ID**
P0:0x01	Hb[8:0]		8	0x6a	RW	Horizontal blanking, unit pixel clock
P0:0x02	Vb[8:0]		8	0x70	RW	Vertical blanking, if current exposure < (Vb + window Height) , frame rate will be (Vb + window Height); otherwise frame rate will be determined by exposure
P0:0x03	Exposure	high	4	0x0	RW	[7:4] NA [3:0] exposure[11:8]，use line processing time as the unit.
P0:0x04	Exposure	low	8	0x96		Exposure[7:0], controlled by AEC if AEC is in function
P0:0x05	Row start	high	1	0x00	RW	Defines the starting row of the pixel array
P0:0x06		low	8	0x00		
P0:0x07	Column	high	2	0x00	RW	Defines the starting column of the pixel array
P0:0x08	start	low	8	0x00		
P0:0x09	Window	high	1	0x1	RW	Defines image height, default 488
P0:0x0a	height	low	8	0xe8		
P0:0x0b	Window	high	2	0x2	RW	Defines image width default 648
P0:0x0c	width	low	8	0x88		
P0:0x0d	vs_st		8	0x02	RW	[7:0] number of Row time from frame start to first HSYNC valid
P0:0x0e	vs_et		8	0x04	RW	[7:0] number of Row time from last HSYNC valid to frame end Notice the relation with

					VB, VB > vs_st+vs_et
P0:0x0f	Vb[11:8]	4	0x00	RW	[7:4] Vb high 4 bits
	Hb[11:8]	4			[3:0] Hb high 4 bits
